DT/NT : DT

LESSON: DevOps

SUBJECT: Ansible 1

Install Ansible

Ad-hoc Commands

BATCH: 149 03/10/2023

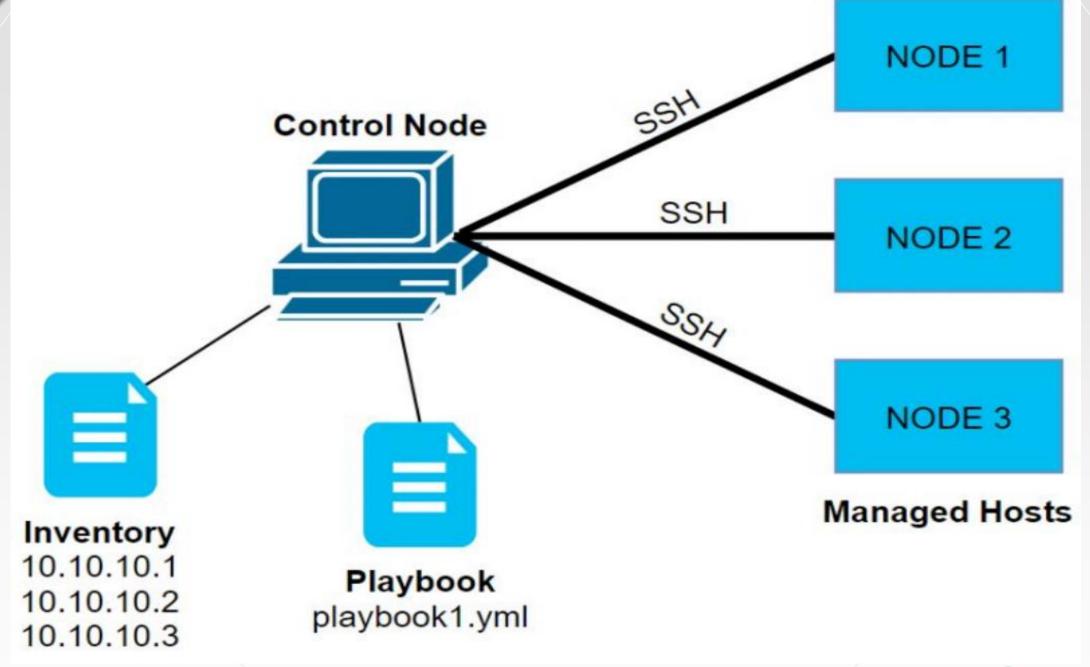

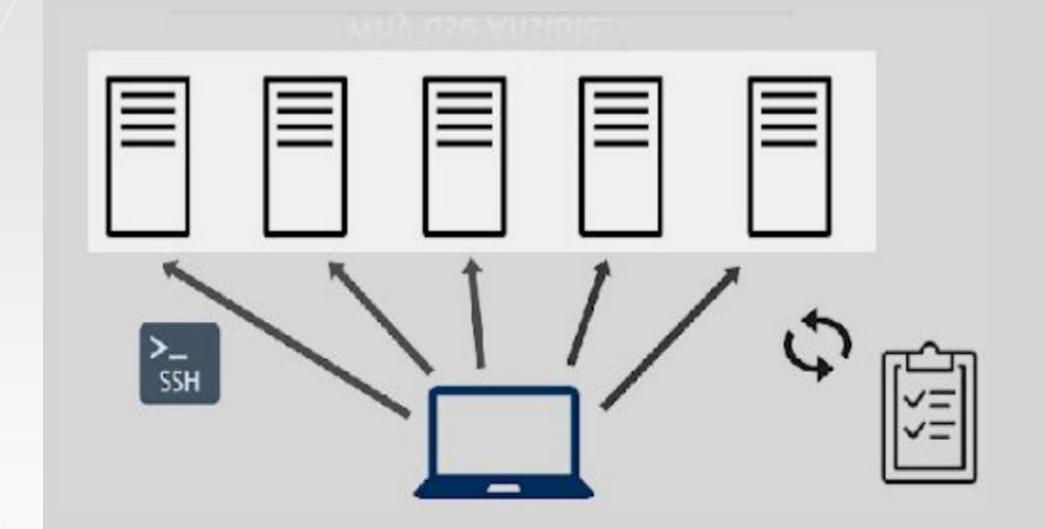

What did I do the last time? 99

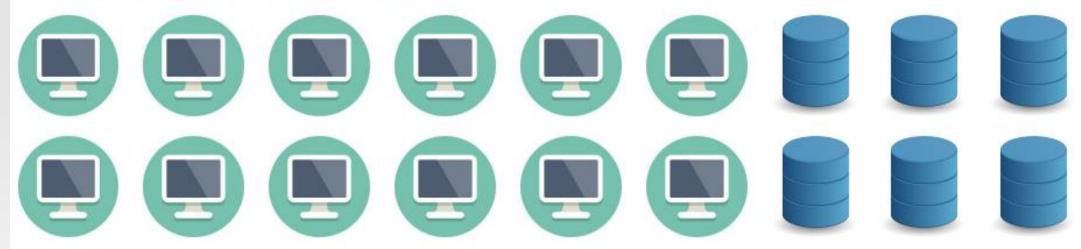

About Ansible

- Time
- Coding Skills
- Maintenance

- Simple
 - Powerfull
- Agentless

About Ansible

Scripts

Playbook

```
- hosts: all_my_web_servers_in_DR
tasks:
- user:
    name: johndoe
```

Installation

We can install Ansible using **yum** and **apt** package managers.

For install with yum: sudo yum -y install ansible

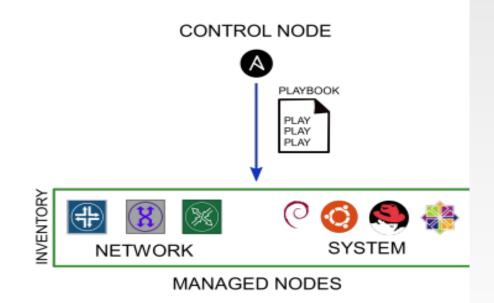

For install with apt: sudo apt-get -y install ansible

Control node:

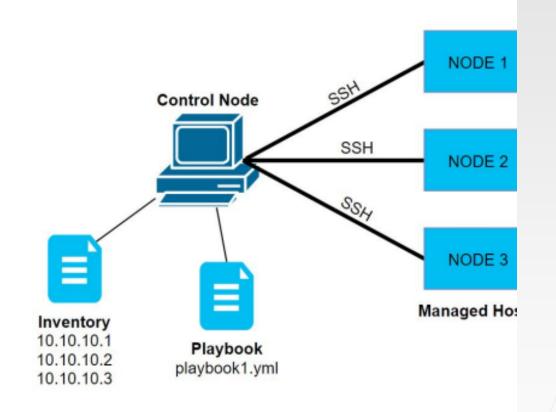

Any machine with Ansible installed. You can run commands and playbooks, invoking /usr/bin/ansible or /usr/bin/ansible-playbook, from any control node. You can use any computer that has Python installed on it as a control node - laptops, shared desktops, and servers can all run Ansible. However, you cannot use a Windows machine as a control node.

Managed Nodes:

The network devices (and/or servers) you manage with Ansible. Managed nodes are also sometimes called **hosts**. Ansible is not installed on managed nodes.

Inventory:

A list of managed nodes. An inventory file is also sometimes called a **hostfile**. Your inventory can specify information like IP address for each managed node. An inventory can also organize managed nodes, creating and nesting groups for easier scaling.

The inventory file

Where it is located

/etc/ansible/hosts

What is the format

[mailservers]

mail.example.com

[webservers]

foo.example.com ansible_ssh_user = user001 bar.example.com ansible_ssh_private_key_file = /.ssh/ansible_key001

[dbservers]

one.example.com two.example.com db-[a:f].example.com

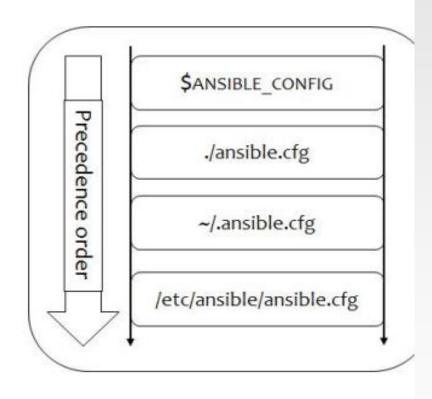

Group hosts for easier inventory selection and less conditional tasks -- the more groups the better.

WHAT	WHERE	WHEN
[db]	[east]	[dev]
db[1:4]	db1	db1
	web1	web1
[web]	db3	
web[1:4]	web3	[test]
		db3
	[west]	web3
	db2	
	web2	[prod]
	db4	db2
db1 = db, east, dev	web4	web2
		db4

Configuring Ansible

- Ansible supports several sources for configuring its behavior, including a file named ansible.cfg, environment variables, command-line options, playbook keywords, and variables.
- Certain settings in Ansible are adjustable via a configuration file (ansible.cfg).
- Changes can be made and used in a configuration file which will be searched for in the following order:

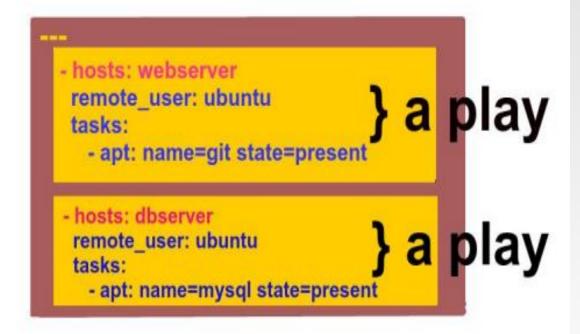

Playbooks:

Ordered lists of tasks, saved so you can run those tasks in that order repeatedly. Playbooks can include variables as well as tasks. Playbooks are written in YAML and are easy to read, write, share and understand.

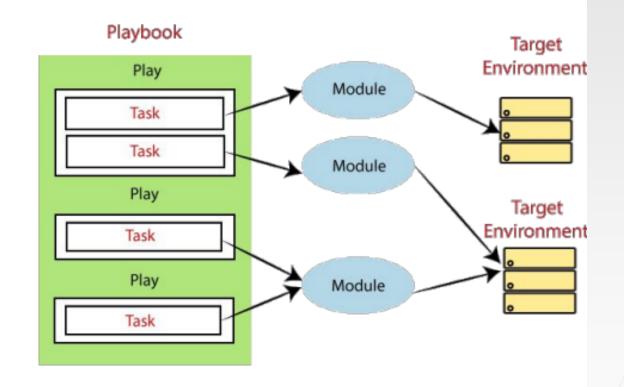

Playbook

Tasks:

The units of action in Ansible. You can execute a single task once with an ad-hoc command.

Modules:

The units of code Ansible executes. Each module has a particular use, from administering users on a specific type of database to managing VLAN interfaces on a specific type of network device.

Modules	Module Categories							
System	User	Group	Iptables	Mount	Ping	Systemd	Service	
Commands	Command	Expect	Raw	Script	Shell			
Files	Ad	Archive	Find	Сору	Replace	Stat	File	
Database	MySQL	MongoDB	MSSQL	PostgreSQ	ProxySQL	Vertica.		
Cloud	Amazon	Azure	Google	Linode	Openstack	VMware	Docker	
Windows	Win_copy	Win_command	Win_msi	Win_ping	Win_msq	Win_shell	Win_path	

ad-hoc Commands

- An Ansible ad-hoc command uses the /usr/bin/ansible command-line tool to automate a single task on one or more managed nodes.
- Ad-hoc commands are quick and easy, but they are not reusable.
- Ad-hoc commands demonstrate the simplicity and power of Ansible.
- Ad-hoc commands are great for tasks you repeat rarely.

AD HOC command

Ansible Playbook

- name: playbook name hosts: webserver tasks: - name: name of the task yum: name: httpd state: latest

ad-hoc commands

ansible <inventory> -m

AD HOC command

Runs a command or calls a module directly from the command line, no Playbook required

```
ansible <inventory> <options>
ansible web -a /bin/date
ansible web -m ping
ansible web -m yum -a "name=openssl state=latest"
```

Ansible

- Simple YAML
- agentless

Puppet and Chef

- Ruby
- More difficult to learn
- Installation needed
- So need for managing updates on target servers

ANSIBLE VE TERRAFORM

FARKLAR

Terraform

- Genellikle Infrastructure provisioning tool(Altyapı sağlama aracı) olarak kullanılır.
- Görece daha yenidir. (2014)
- Orchestration yeteneği daha gelişmiştir.
- Orchestration, bilgisayar sistemlerinin, uygulamaların ve hizmetlerin otomatik yapılandırması, yönetimi ve koordinasyonudur. IT departmanının karmaşık görevleri ve iş akışlarını daha kolay yönetmesine yardımcı olur.

Ansible

- Genellikle configuration tool olarak kullanılır. Yani önce infrastructure oluşturursun. Sonra onu configure etmek için Ansible kullanırsın.
- Terraforma göre daha eskidir. (2012)

ANSIBLE VE TERRAFORM

BENZERLİKLER

 İkisi de IAC tool'u olarak kullanılır. Yani ikisiyle de altyapıyı sağlarız, yapılandırır ve yönetiriz.
